Attorney Docket No. 10541-929

II. Listing of Claims

1-6. (Cancelled).

7. (Currently Amended): A device for producing a contour of a planiform

piece for an interior trim of a motor vehicle, the device comprising:

a cutting means for cutting said piece, for defining at leas: an apex of

said contour, having a given profile P, and a first side, of said contour extending from

said apex, wherein said cutting means includes at least:

a first means for cutting sald piece, for a simultaneous production of at

least said apex, according to said profile P, and of said first side on a fraction F, of its

length extending from said apex, wherein the fraction F is straight;

a second means for cutting said piece, capable of permitting the

production of said first side including at least one part in addition to fraction F, and

wherein said first and second cutting means overlap at fraction F and function

sequentially;

said first cutting means are capable of permitting the simultaneous production.

of a second side of the contour, extending from said apex, over a fraction F', of its

length, extending from said apex, and wherein said cutting means includes a third

means for cutting the piece, to produce said second side, at least in the area of a

part at least of said fraction F', said first and third cutting means functioning

sequentially:

wherein said first cutting means is a first knife having a continuous cutting

edge formed of three parts, a first central part for forming the apex according to said

Attorney Docket No. 10541-929

profile P, a second and a third part extending on each side said ceritral part, for forming fractions F and F'.

sald second and third cutting means are second and third knives, having a cutting edge for forming said first and second sides, at least in the area of a part at least of said fractions F and F';

wherein said cutting means further includes a support, for receiving said piece, such that the latter can be sandwiched, at least over a part of its thickness, between said support and said first, second and third cutting means;

said support has a contour including at least a first part, having a profile substantially identical with that of the cutting edge of the first knife, and a second and a third part located on either side of said first part of the contour of the support in the prolongation of the latter and having a profile substantially identical, with that of the cutting edges of the second and third knives, and

wherein said first and second parts of the contour of the support everlap in the area of a first zone A, for forming a fraction F, and

wherein said first and third parts of the contour of the support overlap in the area of a first zone A', for forming fraction F'

11. (Cancelled).

12. (Currently Amended): The device according to claim [[11]] 7, wherein

said first, second and third knives are mobile between two positions in relation to

said supports, such that a first retracted position in which the cutting edges of said

first, second and third knives are contiguous and in the prolongation of one another,

and facing said first, second and third parts of the contour of the support, and

wherein a second position in which the cutting edges are in contact with said

support, said first knife coming to bear, in a first configuration, against said first part

of the contour of the support, and said second and third knives coming to bear, in a

second configuration, against said second and third parts of the contour of the

support.

13. (Currently Amended): A device for producing a contour of a plantiform

piece for an interior trim of a motor vehicle, the device comprising:

a cutting means for cutting said piece, for defining at leas: an apex of

said contour, having a given profile P, and a first straight side, of said contour

extending from said apex, wherein said cutting means includes at least:

a first curved cutting means for cutting said piece, for a simultaneous

production of at least said apex, according to said profile P, and of saic first straight

side on a fraction F, of its length extending from said apex;

a second straight cutting means for cutting said piece capable of

permitting the production of said first straight side including at least one part in

Attomey Docket No. 10541-929

addition to fraction F, and wherein said first and second cutting means overlap at fraction F and function sequentially:

said first cutting means are capable of permitting the simultaneous production, of a second side of the contour, extending from said apex, over a fraction F', of its length, extending from said apex, and wherein said cutting means includes a third means for cutting the piece, to produce said second side, at least in the area of a part at least of said fraction F', said first and third cutting means; functioning sequentially:

wherein said first cutting means is a first knife having a continuous cutting edge formed of three parts, a first central part for forming the apex according to said profile P, a second and a third part extending on each side said central part, for forming fractions F and F',

said second and third cutting means are second and third knives, having a cutting edge for forming said first and second sides, at least in the area of a part at least of said fractions F and F'; and

wherein said cutting means further includes a support, for receiving said piece, such that the latter can be sandwiched, at least over a part of its thickness, between said support and said first, second and third cutting means.
